

### Abstract of the Disclosure

A cosmetic brush is mounted on an inside can with a connecting sill formed on one end of its circumference near the brush, and a first stop protrusion formed on one side of the connecting sill. A second stop protrusion is formed on the circumference of the inside can near the opposite end. An outside can is formed on the circumference of the inside can. A sliding can is disposed between the inside can and outside can. A tube provides air into a powder can in response to pressure on a spring biased button for applying powder to the brush. In use the brush is can be extended for use only a limited distance so as to avoid damage to the brush.
